LEATHER

THE SUSTAINABLE CHOICE

Leather is one of the original examples of sustainability and the responsible answer to what would otherwise be a major environmental issue.

The Greatest Recycling Story

The leather industry diverts approx. 285 million hides of by-product waste annually from landfills, recycling hides into a durable, functional, timeless product.

Salvaging the waste of one industry to create something useful that will outlast the alternatives, lessens the need to replace, which in turn cuts down on future processes and industry. This is the very definition of circularity.

Meeting High Standards

Our tannery partners are required to be REACH Compliant and are in full compliance with water treatment regulations. Additionally, many of our tanneries are part of the Leather Working Group, an organization that is focused on improving sustainable practices within the leather industry.

We choose to work with tanneries that are excellent stewards of the environment and their communities and are often leading the way toward new and innovative chemistry and processes to further evolve the tanning industry.

The World's Most Sustainable Leather

One of the latest advancements for leather is the Wet-green method called Olive tanning—A completely organic, water-based tanning agent created from the by-product of fallen leaves from olive trees. This groundbreaking tanning method is the most sustainable method available in the industry today and has received the Cradle to Cradle Gold award.

Moreover, our Olive tanned articles are the first in the world to receive the red list free Declare label and qualify for LEED points on sustainable projects worldwide.

For This Generation And The Next

The inherent, primal connection between leather and humans often evokes an emotional response. With age and use, leather gains character and beauty, becoming a beloved part of the owner's story.
